

José Luiz Monteiro Junior

Senior Full-Stack Software Engineer | Frontend-Focused

Santa Lúcia, PR, Brazil | Remote (UTC-3, overlaps US business hours)

+1 443 455 0136 | joseluizmonteirojr@gmail.com | linkedin.com/in/jose-luiz-monteiro-junior | github.com/jlmjr-dev

PROFESSIONAL SUMMARY

Senior full-stack software engineer with a frontend focus and 10 years of experience building and scaling web, mobile, and micro-frontend enterprise applications across healthcare, payments, and ERP domains. Deep expertise in the React ecosystem (React, Next.js, TypeScript, React Native), backed by hands-on Node.js/TypeScript service work and GCP/Kubernetes delivery. Track record of owning cross-cutting initiatives end to end: Next.js and React platform upgrades, a Yarn to pnpm monorepo and CI migration, a TypeScript monorepo consolidating four production webhook services, and a REST to GraphQL migration on a payments platform. Effective across the full delivery chain, from design-system components to CI/CD pipelines and Kubernetes deployments, and a daily user of AI-assisted development tooling (Claude Code, Cursor, GitHub Copilot).

TECHNICAL SKILLS

Core Stack: TypeScript | JavaScript (ES6-ES2023) | React | Next.js | React Native | Node.js | HTML5 | CSS3

Frontend Architecture: Micro-frontends | Design Systems & Component Libraries | Storybook | CSS Modules with Sass | Styled-components | Radix UI | Redux | xState | MobX | Zustand | Apollo Client | TanStack Query | React Hook Form | AngularJS

APIs, Data & Platform: GraphQL | REST | Express | PostgreSQL | MySQL | SQLite | Hygraph (headless CMS) | LaunchDarkly | Sentry | Amplitude | i18n / Localization

Build & Monorepo: pnpm | Yarn Workspaces | Turborepo | Lerna | Webpack | Turbopack | ESLint | Prettier | Husky | Conventional Commits

CI/CD & Cloud: GitHub Actions | Buildkite | Jenkins | Terraform | Docker | Kubernetes | Google Cloud Platform (Cloud Run, Cloud Build, Artifact Registry, Parameter Manager, GCS, Firestore)

Testing & Quality: Jest | React Testing Library | Playwright | Cypress | Unit & Integration Testing | Snapshot Testing | Accessibility (WCAG) | Structured Logging & Observability | Content Security Policy

Working Knowledge (supporting or earlier roles): Java | Kotlin | C# / .NET | PHP | Svelte | Spring Boot | AWS (S3, CDN, SQS, SNS, ECS, RDS) | Ansible | Redis | Firestore

Practices & Tools: Agile / Scrum | SAgile | Jira | Technical Leadership | Release & Change Management (CAB) | Git | AI-Assisted Development (Claude Code, Cursor, GitHub Copilot)

Spoken Languages: Portuguese (Native) | English (Advanced/Fluent) | French (Beginner)

PROFESSIONAL EXPERIENCE

Collective Health (contractor via ExtendedTeam) | Remote (US-based company)

Senior Software Engineer | Mar. 2021 – Jun. 2026

- Owned the Webhook Consolidation initiative end to end: authored the epic and a six-phase migration plan, then architected a TypeScript/Node.js monorepo (pnpm, Turborepo, Express) merging four Dialogflow CX webhook repositories into one shared-library codebase re-scoped into context-scoped services; built the shared layer (OAuth2 client with token caching and request de-duplication, structured logging with recursive PII masking, AJV validation, retry and timeout primitives) and integrated Zendesk, Qualtrics, JSM/OpsGenie, NPI Registry, Firestore, GCS, and Google Maps; also prototyped a custom live-chat UI on the headless CCAIP SDK, replacing the embedded vendor widget so the experience could be tested end to end and styled to match the product.
- Cut member authentication from three backend round trips to one by moving three-factor identity collection into the Dialogflow conversation and validating all three in a single call, so each prompt answers instantly instead of waiting on a backend response.
- Replaced a branch-per-environment deployment model with an artifact-promotion pipeline: labelled feature branches deploy to dev or testing, main auto-deploys to testing, and staging and production accept only reviewed images promoted from validated environments; built the GitHub Actions and Terraform path onto Cloud Run and split the Workload Identity Federation modules so each service gets a repo-scoped deploy identity with no long-lived keys.
- Led the member web platform's framework and build modernization across a monorepo of three apps and 20+ libraries: Next.js 11 to 14, React 17 to 18, Webpack 5, Node 18 to 22, Turbopack, Prettier 2 to 3, Husky 4 to 9, and a full Yarn to pnpm migration, with React 19 and Next.js 15 underway.
- Improved Core Web Vitals and reliability on the sign-in path: removed two render gates and inlined i18n so i18next initializes synchronously, resolving an LCP/TTI regression that was tripping the synthetic login-timeout monitor; also fixed post-upgrade hydration mismatches, a chat-widget race condition, and build-asset cache busting.
- Maintained the internal design system with product and design: migrated dialogs from @reach/dialog to @radix-ui for accessible primitives, added screen-reader-only titles and localized accessibility copy, documented components in Storybook, and published them as individually versioned packages.

- Built the web authentication experience: password sign-in issuing JWTs, MFA over SMS and email, a trusted-device flow with a 30-day token, password reset, identity-lookup registration, SSO deep-linking with relay-state, and idle session handling.
- Shipped member-facing product work: AI-powered claims search behind a feature flag with new filters, pagination, and faster results without disrupting the existing UI/UX; built the React inbox and retired the legacy standalone Svelte application; parental attestation and PHI access-level rollout; ID cards, spending accumulators, and utilization tracking.
- Owned internationalization from the start: locale-aware request layer, state machines, and cookie handling, Spanish localization across the portal, and content moved to runtime CDN fetch and Hygraph headless CMS.
- Migrated the monorepo and its Buildkite plugin from Yarn to pnpm, roughly halving install times, cut the pull-request pipeline from 29 to 16 minutes, and automated prerelease versioning, removing a manual step that every rebase invalidated.
- Owned web release management: change-advisory (CAB) tickets raised and defended at the review board, documenting QA sign-off, environments verified, rollback and post-deployment verification plans, and the feature-flag inventory with planned toggle dates; ran five years of Kubernetes infrastructure-as-code deployments and added Content Security Policy headers to the Ansible ingress template.
- Built and modernized internal admin micro-frontends: a benefits configuration tool replacing hand-edited plan JSON with forms, drag-and-drop ordering, and per-field override inheritance across default, plan, and sponsor levels, cutting plan review from days to hours; the React/TypeScript rewrite of legacy AngularJS tools; and plan administration (stacked cost shares, benefit limits), where I introduced Storybook.
- Worked full-stack on payments: led the frontend REST-to-GraphQL migration from TanStack Query to Apollo Client, and on the Java/GraphQL billing service built invoice and report state machines, account models, and the MSOON reimbursement subsystem.
- Onboarded and mentored junior engineers into the codebase and the team's ways of working, ran knowledge-transfer sessions on systems I built and technologies I proposed, and authored 14 Confluence pages adopted as team reference: migration playbooks, architecture spikes, and build-versus-buy analyses.

Localiza (contractor via Meta) | Remote (Brazil-based company)

Senior Frontend Software Engineer | Nov. 2020 – Mar. 2021

- Engineered the frontend of Zarp, a greenfield SaaS platform providing car rentals to rideshare drivers (Uber, 99), inside an Agile Scrum program running the SAFe framework: responsive, cross-browser React interfaces with JavaScript (ES11) and Styled-components, React-Redux state management, integration with C#/.NET and Microsoft SQL Server services, and Jest unit tests on core flows.

Totvs | Cascavel, Paraná, Brazil

Senior Software Engineer | Jun. 2017 – Nov. 2020

- Designed and built a customization engine inside the core of a legacy Java ERP, letting each client's visual identity be configured through the product itself and sharply reducing the effort to onboard or migrate a client.
- Worked on the planning, definition, and development of a B2B e-commerce platform for Seara Foods (JBS), one of the company's largest accounts, fully integrated with the client's ERP using Magento 1.x, PHP, and MySQL.
- Joined the innovation unit to work on a new SaaS CRM, contributing to the creation and development of the reusable React UI/UX component library used across the CRM teams, and working on the product's offline-first React Native mobile app (SQLite, KnexJS) synchronizing asynchronously against a distributed Spring Boot and AWS backend, including a camera-based business-card capture feature using the Google Cloud Vision API to read a prospect's details and pre-fill the CRM lead form at events.

Dimebras | Remote, Brazil (Freelance, concurrent with Totvs)

Full-Stack Engineer (B2B & B2C E-commerce) | Feb. 2019 – Mar. 2020

- Delivered web and mobile e-commerce applications for a pharmaceutical distributor, from prototypes and MVPs through production: React and React Native frontends on an AdonisJS, PostgreSQL, and Redis backend, full integration with the client's existing ERP, separate test and production environments, and direct client contact for estimation and negotiation.

MV | Cascavel, Paraná, Brazil

Software Engineer | Nov. 2015 – Jun. 2017

- Developed new features and provided production support for the largest public health management system in Brazil (Java, JPA/Hibernate, jQuery, PostgreSQL), and contributed to an infrastructure modernization program that migrated version control from Apache Subversion to Git and consolidated legacy applications into a single product suite.
- Joined the S.A.M.U. (Mobile Emergency Medical Service) project at its start as a frontend developer, building the interface in TypeScript and AngularJS and taking part in UI/UX analysis with the client.

EDUCATION

Postgraduate Specialization (Lato Sensu) in Game Design

Universidade Positivo, Cascavel, Paraná, Brazil | Mar. 2018 – Feb. 2019

Bachelor's Degree in Systems Analysis and Development

Centro Universitário de Cascavel (Univel), Cascavel, Paraná, Brazil | Jan. 2014 – Dec. 2016
